## Configuration Management

---

*Configuration management (CM) is a systems engineering process for establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design, and operational information throughout its life.*

*Locking down and properly configuring IoT devices, servers, workstations and network infrastructure platforms has long been a mainstay of best practices in information security.*

---

---

*This typically includes securing local services and applications, setting permissions on files and directories, improving access control parameters such as SSH, limiting privileged user access, and tweaking device configurations*
